Assigned a Static IP Address:

I Opened Network Connections, right-clicked the Wi-Fi adapter, and noted the temporary IP address.

I Set a static IP address by entering the IP Address, Subnet Mask, and Default Gateway in the Internet Protocol Version 4 (TCP/IPv4) properties.

Installed FTP Software:

I Enabled FTP service from the Windows Features page by checking the FTP Server and Web Management Tools options under Internet Information Services (IIS).

Configured the FTP Server:

I Moved files to a designated folder.

I Opened IIS Manager, added a new FTP site, and set the physical path to the folder.

I Entered the static IP address and port 21, selected "No SSL," and configured basic authentication.

I Allowed specific users with read and write permissions.

I Created an FTP User Without a Microsoft Account:
Added a new user in Settings > Accounts > Other Users without a Microsoft account.

I Granted the new user full control over the FTP directory through the folder's security properties.

Configured Firewall Settings:

I Attempted to allow FTP server through private and public networks in Windows Firewall, but ultimately turned off the

firewall completely.

Connected via FTP Client:

I Downloaded an FTP client on your mobile phone, entered the necessary details, and connected to the FTP server
